EDUCATION

G. H. Patel College of Engineering & Technology, Vallabh Vidyanagar

B. Tech in Computer science and engineering (IoT), Minor in Robotics

IELTS: 6.5 Bands (B2 Level)

2021-2025

CGPA: 7.85 / 10

TECHNICAL SKILLS

Software/Tools: Git, Docker, Terraform, Nginx, PostgreSQL, GitHub Actions, AWS Service Suite

Programming Language: C++, Python

Platforms: AWS, Hetzner

CERTIFICATIONS

• [AWS Solutions Architect Associate](#) • [Terraform Associate](#)

LEADERSHIP

Technical Head - [Tech Know Talk Club](#)

2022 - 2023

- Led the technical planning and execution of club events with a student-driven approach focused on peer-to-peer learning. Conducted a hands-on workshop on Unity Engine and game development and maintained technical documentation for club activities.

PROJECTS

1. [Cloud Native Secure License Distribution & Validation Service](#)

Tech Stack: FastAPI, AWS DynamoDB, AWS API Gateway, Route 53, Hetzner Cloud, Docker, Nginx, Prometheus, Grafana, Beszel, Certbot

- Architected and deployed a production-grade licensing platform on a Hetzner Cloud VPS and applied VPS security best practices, leveraging Dockerized FastAPI services for software activation and license validation workflows.
- Integrated AWS DynamoDB as a highly available NoSQL backend for license life-cycle management and enable PITR.
- Configured AWS API Gateway HTTP APIs as a secure ingress layer for public-facing endpoints and implemented authentication using internal secret-based header validation.
- Provisioned and configured Nginx reverse proxy with subdomain-based routing and managed DNS records through AWS Route 53. Established full-stack observability with Prometheus, Grafana, and Beszel.

2. [Automated CI/CD Pipeline for Containerized Applications](#)

Tech Stack: GitHub, GitHub Actions, Watchtower, Docker, VPS

- Built a lightweight CI/CD solution where GitHub Actions served as the CI engine, automatically building and publishing Docker images to Docker Hub upon repository updates.
- Configured Watchtower as a container update service on a VPS to detect image changes, pull the latest image versions, perform rolling container replacement, and remove obsolete images. Implemented automated image life cycle management, ensuring application deployments remained synchronized with source code changes while minimizing downtime and operational overhead.

WORK EXPERIENCE

Summer DevOps internship at [Ekaantik](#)

January – April 2025

- Trained on advanced Docker, Terraform, and Kubernetes concepts, including Docker Compose, zero-downtime updates, resource allocation (vCPU/RAM), policy management, and database backup automation; practiced Terraform for AWS infrastructure setup and learned CI/CD pipelines using GitHub Actions.
- Deployed the services on a local single-node Kubernetes cluster using Helm charts, and managed multi-component services including Spring Boot, PostgreSQL, MongoDB, Neo4j, Redis, and Rocket.Chat.
